Order from SLA mi$2.40, ph$3.30 61-14469

Trans. of Glastechnische Berichte (West Germany), 1960, v. 33, no. 9, p. 332-338.

After digesting the silicate with hydrofluoric and perchloric acids, the sulfate is reduced to H_2S by treating it with a suitable reducing agent. The H_2S is then absorbed in a sodium hydroxide solution and determined by volumetric analysis. This method can be used in the range from 1 to 1000 µg SO_3 and, with samples weighing between 1 and 200 mg, 0.05 to 0.001% SO_3 can be detected. The relative standard deviation of this method is dependent upon the total quantity being determined and lies between 1 and 3%. (Author)
